

NAME

unflatten – adjust directed graphs to improve layout aspect ratio

SYNOPSIS

unflatten [**-f**] [**-llen**] [**-clen**] [**-o outfile**] [files]

DESCRIPTION

unflatten is a preprocessor to **dot** that is used to improve the aspect ratio of graphs having many leaves or disconnected nodes. The usual layout for such a graph is generally very wide or tall. **unflatten** inserts invisible edges or adjusts the **minlen** on edges to improve layout compaction.

OPTIONS

The following options are supported:

-l len The minimum length of leaf edges is staggered between 1 and *len* (a small integer).

-f Enables the staggering of the **-l** option to fanout nodes whose indegree and outdegree are both 1. This helps with structures such as *a* -> {*w x y z*} -> *b*. This option only works if the **-l** flag is set.

-c len Form disconnected nodes into chains of up to *len* nodes.

-o outfile

causes the output to be written to the specified file; by default, output is written to **stdout**.

OPERANDS

The following operand is supported:

files Names of files containing 1 or more graphs in dot format. If no *files* operand is specified, the standard input will be used.
